Amine Benmansour

Application architect · Java, Kafka, applied AI · cards, payments and fraud

contact@iaminetech.com · +33 6 51 58 59 28 · Île-de-France

PROFILE

14 years of Java experience, 11 of them inside the systems of major French banks (Crédit Agricole, Société Générale and BPCE groups, and Bpifrance). A consultant since 2012, first with IT services firms and then as an independent. I designed the application and data-flow architecture of card, mobile-payment and fraud-prevention systems, and led their delivery, most often as tech lead or team lead. I apply generative AI to the day-to-day work of delivery teams: AI champion for my team on my current assignment (an agent that analyses production incidents), and AI assistance that runs locally in medical practice software.

SKILLS

Architecture	application and data-flow architecture, microservices, event-driven architecture, DDD, hexagonal architecture, Event Sourcing / CQRS, sagas and compensation, idempotency, REST / OpenAPI, ADRs
Applied AI	coding agents, MCP servers (code repository, tickets, documentation, logs, image registry), GitHub Copilot, Claude Code
Card payments	issuing and card lifecycle (activation, blocking, PIN), Apple Pay / Google Pay tokenisation, balance check and Visa response-time constraints, fraud, disputes
Flows and data	Kafka (Avro contracts, Schema Registry, retry, dead-letter), IBM MQ, RabbitMQ, ActiveMQ, Spring Batch, CFT, PostgreSQL, Oracle, MongoDB, SQL Server, Flyway
Integration	core banking, card processor, IBM mainframe (CICS / CTG), OAuth 2.0, SAML
Platform	Kubernetes (GKE, OpenShift), Google Cloud, Helm, Kustomize, ArgoCD, GitLab CI/CD, Jenkins, SonarQube
Operations	Dynatrace, Grafana, Elasticsearch / Kibana, Datadog, Gatling load testing, production incident management
Development	Java 8 to 21, Spring Boot 2 and 3, GraalVM, TDD / BDD (Cucumber), JUnit, Testcontainers
Regulation	PCI DSS, DORA, AML (KYC), ACPR requirements

EXPERIENCE

LCL (Crédit Agricole group)

December 2025 – present

Senior Java engineer and AI champion (team of 4), application and data-flow architecture

- Customer fraud-confirmation journey (card, transfer, cheque): design and development of the Java 21 / Spring Boot 3 microservices, the Kafka flows with Avro contracts, the REST APIs and the mainframe exchanges (CICS / CTG), and later enhancements.
- Error recovery without duplicate effects: Kafka retry strategy, replayable dead-letter topic and a step-tracking table in which each successful step is recorded and never replayed (a replay does not block a card twice). Since go-live: no duplicate observed, failed messages replayed without manual database fixes.
- Resilience pattern documented and presented to other teams for Kafka consumers that chain several external calls: orchestration, PostgreSQL step-tracking table, dead-letter and monitoring.
- Applied AI: incident-analysis agent run on demand by a business analyst or a developer, with the AI tool approved by the client (logs, tickets, monitoring and deployed images, through MCP servers). First diagnosis in minutes instead of several hours by hand; used regularly by the team, presented to other teams. Agent-assisted CVE remediation.
- Secure file-transfer component: Spring Batch, encryption, CFT.

Java 21, Spring Boot 3, Kafka, Avro, REST, CICS / CTG, PostgreSQL, Spring Batch, CFT, Kubernetes, ArgoCD, GitLab CI, Dynatrace

BforBank (Crédit Agricole group)

January 2023 – September 2025

Tech lead (team of 2 to 3 developers), card and tokenisation platform

- Application architecture and development of the Java 21 / Spring Boot 3 microservices for the card lifecycle (issuing, activation, blocking, PIN) and Apple Pay / Google Pay tokenisation, in hexagonal architecture.
- Tokenisation performance: response time roughly halved. Network latency traced end to end in Dynatrace, microservices merged to remove intermediate calls, request-reply over Kafka replaced by direct HTTP calls, PostgreSQL indexes reworked.
- Balance check between the bank, the card processor and Visa: investigated the bank's response times and the use of stand-in authorisation.
- Data-flow architecture: Kafka event-driven design, and the trade-off between synchronous calls and Kafka to meet Visa's response times; REST / OpenAPI contracts with the card processor and the core banking system.

- Latency between GCP and on-premises: interconnect gateway and direct DNS resolution checked with the cloud network team.
- Migration from Spring Boot 2 to 3 and GraalVM Native Image; GitLab and ArgoCD CI/CD on GKE, SonarQube, CVE tracking, Datadog and Dynatrace observability; Clean Code and TDD / BDD promoted through code review.

  Java 21, Spring Boot 3, Kafka Confluent and Schema Registry, REST / OpenAPI, GCP / GKE and on-premises, ArgoCD, GitLab CI/CD, PostgreSQL, GraalVM, Datadog, Dynatrace

Société Générale July 2021 – December 2022

Team lead and Java developer (team of 4 to 6 developers), retail banking document management APIs

- Architecture of the Spring Boot APIs in front of document management and of the Spring Batch jobs, within a SAFe train.
- Gatling load tests: bottlenecks found and fixed (saturated connection pool, slow queries), response times cut by about 30%; deployment automation, code review, onboarding of newcomers.

  Java 8, Spring Boot 2, Spring Batch, MongoDB, S3-compatible object storage, Gatling, Jenkins

BPCE-IT October 2019 – July 2021

Tech lead (team of 4 to 6 developers), group private cloud portal

- Event Sourcing / CQRS application architecture and the portal's state machine; stateless Spring Boot microservices built with TDD.
- Automated virtual-machine provisioning flows and multi-provider management over RabbitMQ: time to obtain a machine cut from several days to a few minutes; attribute-based access control (ABAC), cost chargeback.

  Java 8, Spring Boot, Event Sourcing / CQRS, RabbitMQ, MongoDB, PostgreSQL, Jenkins

Bpifrance February 2018 – September 2019

Development team lead (team of 2 to 3 developers), customer portal for financing products

- Application architecture of the new customer portal in Clean Architecture and of the REST exchanges; technical leadership and code review; REST services with TDD, Jenkins CI, OpenShift deployment. Portal went live during the assignment.

  Java 8 / 10, Spring Boot 2, JAX-RS, JPA, Angular, Oracle, Jenkins, OpenShift

Natixis Wealth Management September 2015 – February 2018

Java developer and team lead (team of 2 to 3 developers), KYC, customer risk rating and identity federation

- Private-bank applications in hexagonal architecture (customer risk rating under AML and ACPR requirements, KYC completeness, mobile customer area); identity federation with a SAML identity provider (OpenSAML); life-insurance application services.

  Java 7 / 8, Spring / Spring Boot, JBoss, SQL Server, OpenSAML, Jenkins

EARLIER EXPERIENCE

Sopra Steria, for RATP and Île-de-France Mobilités (February 2012 – August 2015): Java / JEE developer. Real-time passenger information flows (OSGi / Karaf, Apache Camel, CXF, ActiveMQ), traffic control interface, geographic reference data (Hibernate, PostgreSQL).

PERSONAL PROJECTS

IAMINE Compta (2026): double-entry accounting on top of a banking API; PostgreSQL ledger whose balance is enforced by the database, chained immutable entries, bank ingestion published to Kafka with one idempotency key per transaction (Quarkus / GraalVM). Replaying a full financial year gives the same profit and loss account as the accounting firm's.

Liam Medical (2025 – 2026): medical practice software built on my own and delivered to a practice in March 2026 (Java 21, Spring Boot 3, PostgreSQL); the AI assistance runs locally, so a patient's record never goes to an online service.

EDUCATION AND LANGUAGES

Master's degree in Information Systems (MIAGE), Université Nice Sophia Antipolis (2012). French (native), professional English, Arabic.
